I. Overview of Frontend Development Setup

The frontend of the Quick Reserve system is designed to provide a simple and easy-to-use interface for booking bus tickets online. Its main purpose is to help users quickly understand how to use the system, from searching trips to confirming their bookings, without confusion.

The system is developed using **HTML**, **CSS**, and **JavaScript**, with **Bootstrap** to make the design responsive. This means the website can adjust and work properly on different devices such as mobile phones, tablets, and desktop computers. The layout is organized with clear buttons, menus, and sections so users can easily navigate through the system.

Quick Reserve includes important features such as user registration and login, searching for trips based on origin, destination, and date, selecting available seats, and confirming bookings. Each feature is designed to be straightforward so users can complete their transactions faster and more conveniently. Visual elements like forms, buttons, and tables are used to guide users step by step.

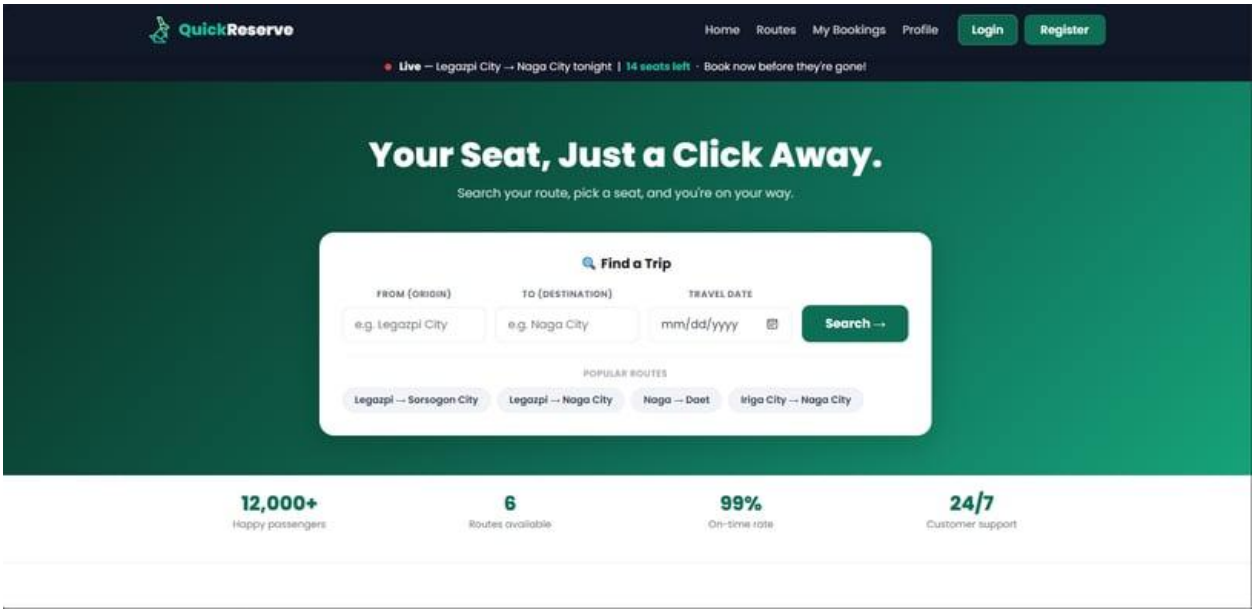
The system also supports two types of users: passengers and administrators. Passengers can book tickets, view their reservations, and cancel bookings if needed. On the other hand, administrators have access to manage trips, schedules, and booking records through a separate interface.

Overall, the frontend of Quick Reserve focuses on simplicity, accessibility, and efficiency. It ensures that users can interact with the system easily while providing a smooth and reliable booking experience.

II. Frontend Screenshots & Annotation

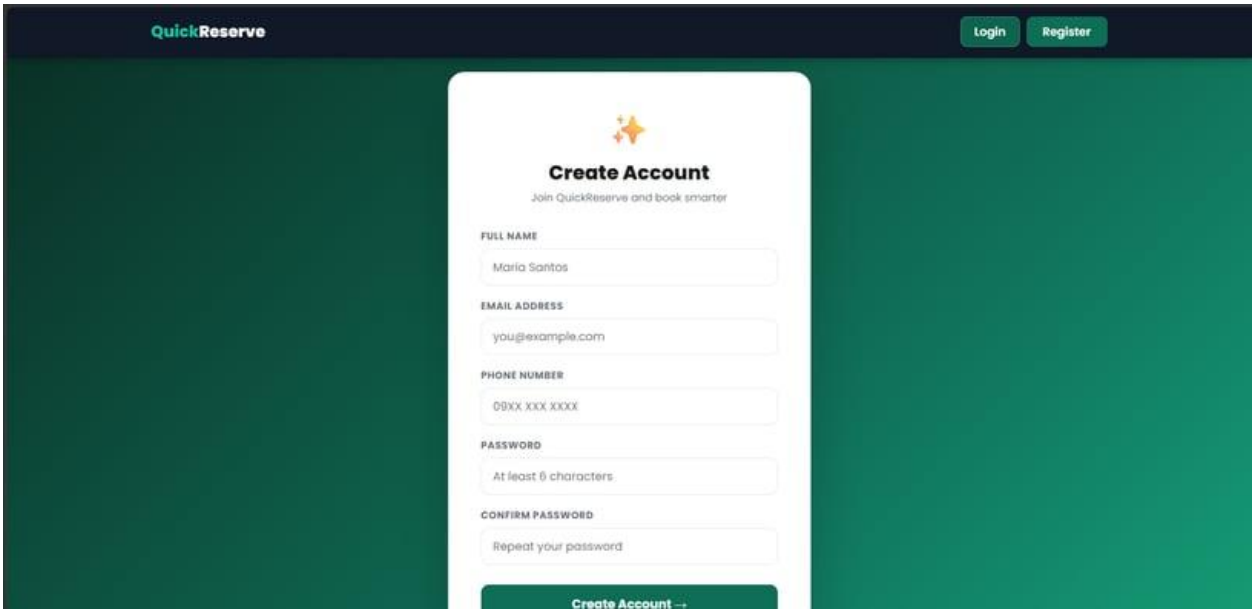
1. Main Page / Landing Page (QuickReserve)

This is the main interface where users can search for available trips by entering their origin, destination, and travel date. It features a clean and responsive layout with quick navigation options such as Home, Routes, My Bookings, and Profile. The page also highlights popular routes and system statistics (e.g., total passengers, available routes), providing users with a quick overview of the system's services.



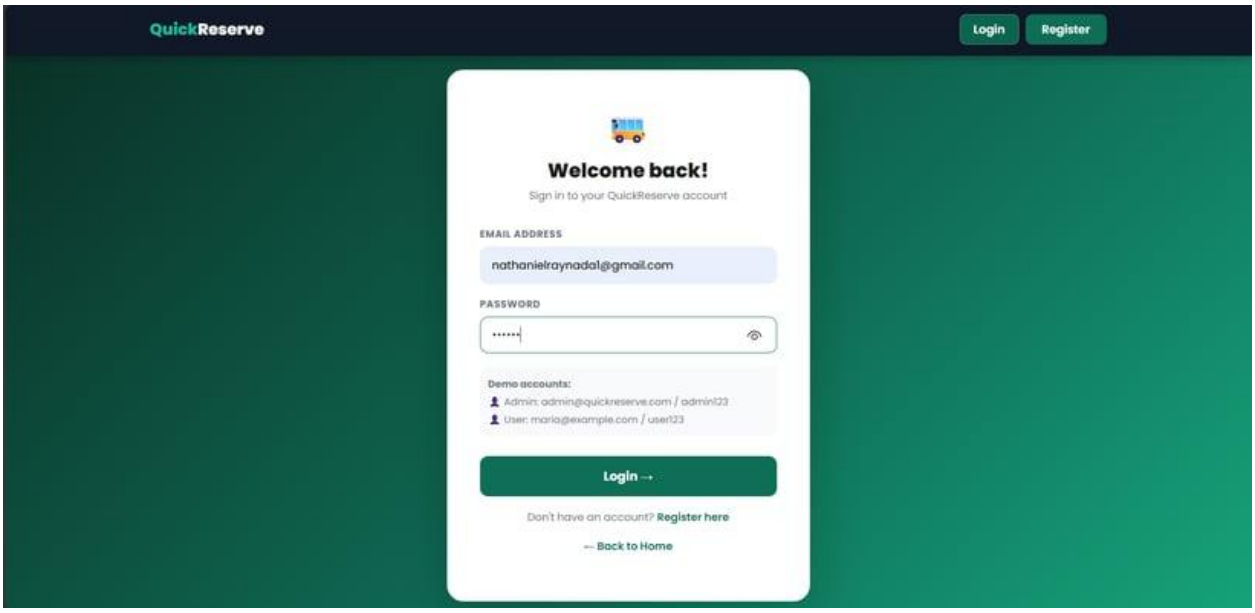
2. User Authentication: Registration Page

The Registration page allows new users to create an account by providing essential personal details such as full name, email address, phone number, and password. This ensures that user information is properly stored and can be used for booking and identification purposes within the system.



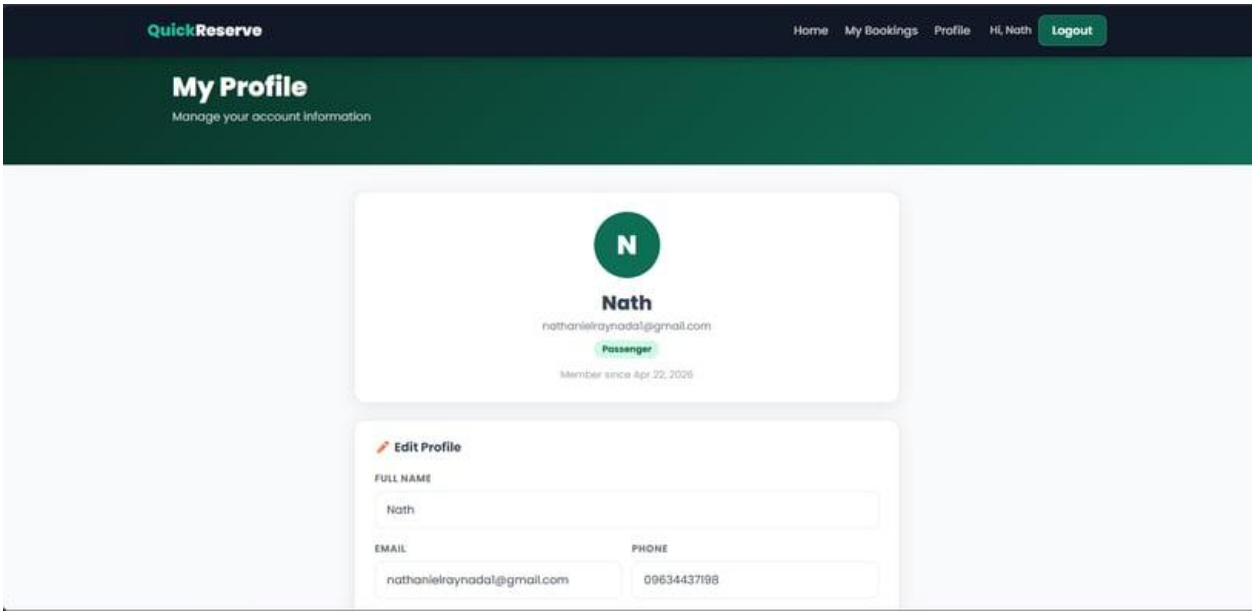
3. User Authentication: Login Page

The Login page enables registered users to securely access their accounts using their email and password. It includes a user-friendly interface with features such as password visibility toggle and quick navigation options for account registration or returning to the homepage.



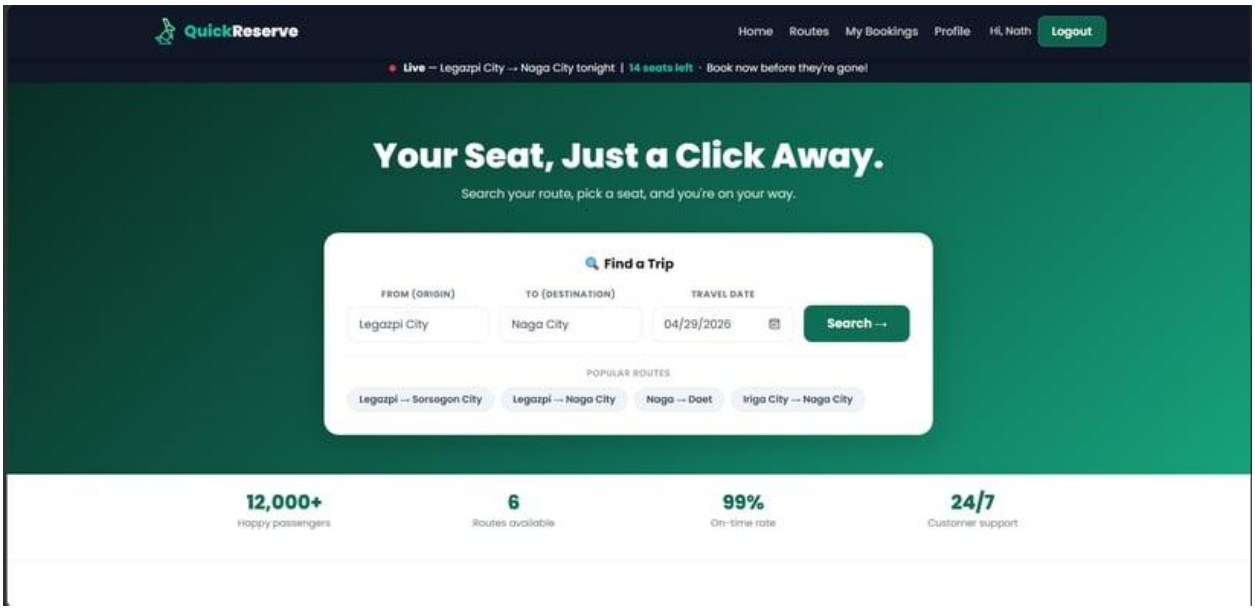
4. User Profile Page

This page allows users to view and manage their personal account information. It displays essential details such as name, email, and membership status, and also provides editable fields for updating profile information, ensuring that user data remains accurate and up-to-date.



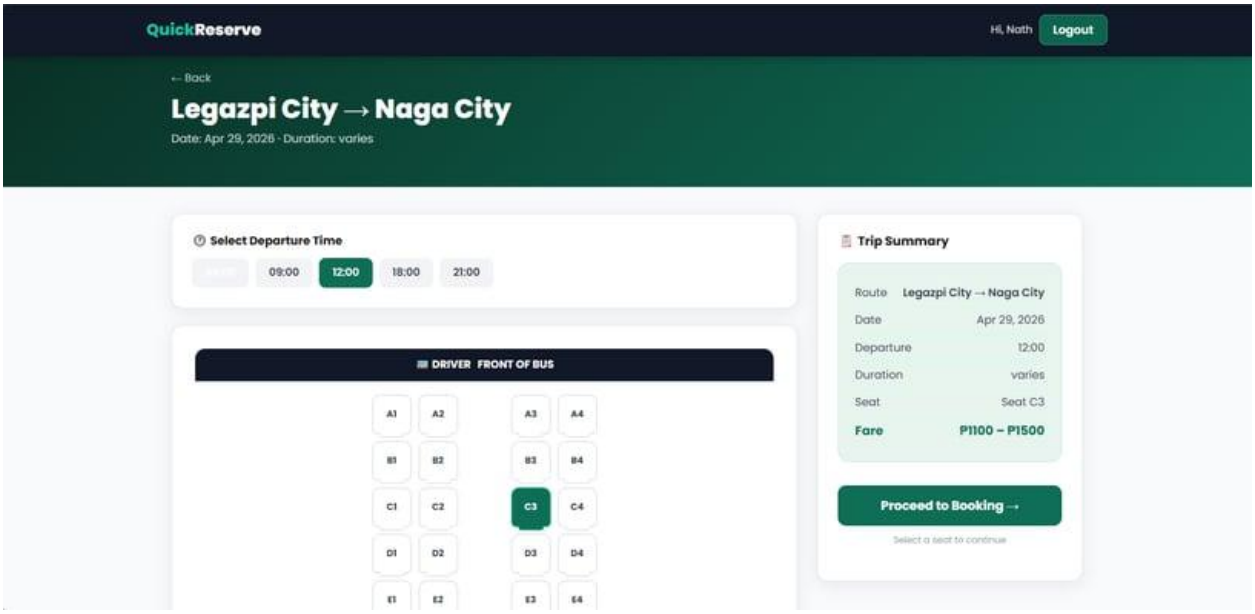
5. Trip Search Functionality (Homepage with Input)

This section demonstrates the trip search feature where users input their desired route and travel date. Once submitted, the system processes the request and prepares the user for the next step of selecting available trips and schedules.



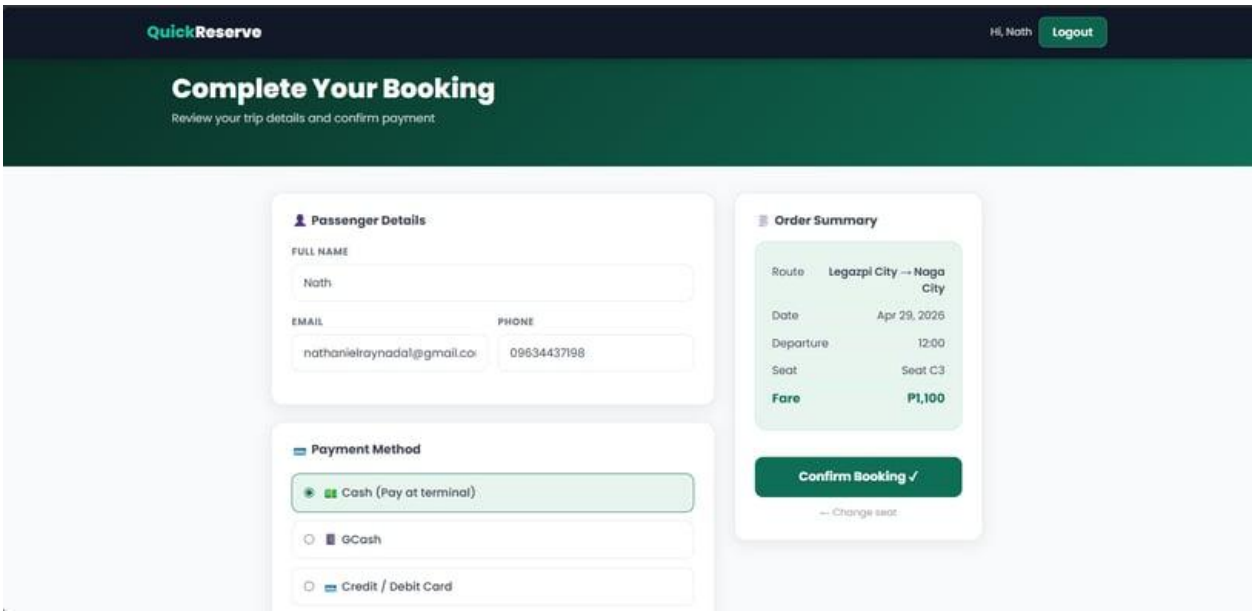
6. Trip Details & Seat Selection Page

This page allows users to select their preferred departure time and choose an available seat from the bus layout. It also displays a trip summary including route, date, and fare, helping users make informed decisions before proceeding to booking.



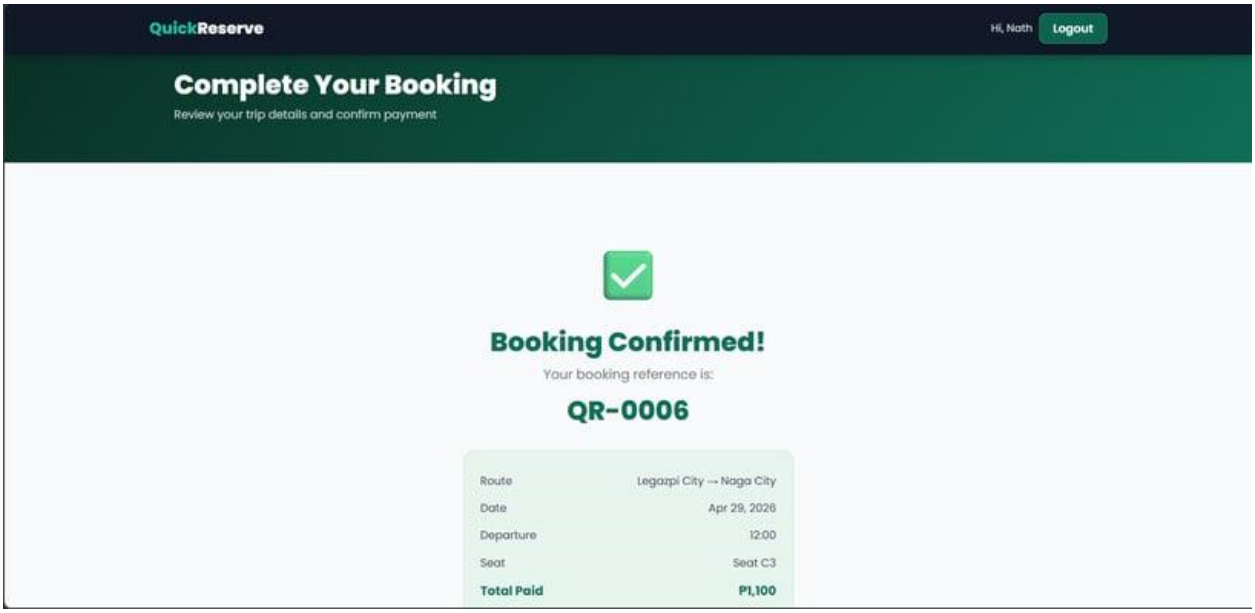
7. Booking Details & Payment Page

This page enables users to review their booking information and provide passenger details. Users can also select their preferred payment method (e.g., Cash, GCash, or Card). The system ensures all details are verified before confirming the booking.



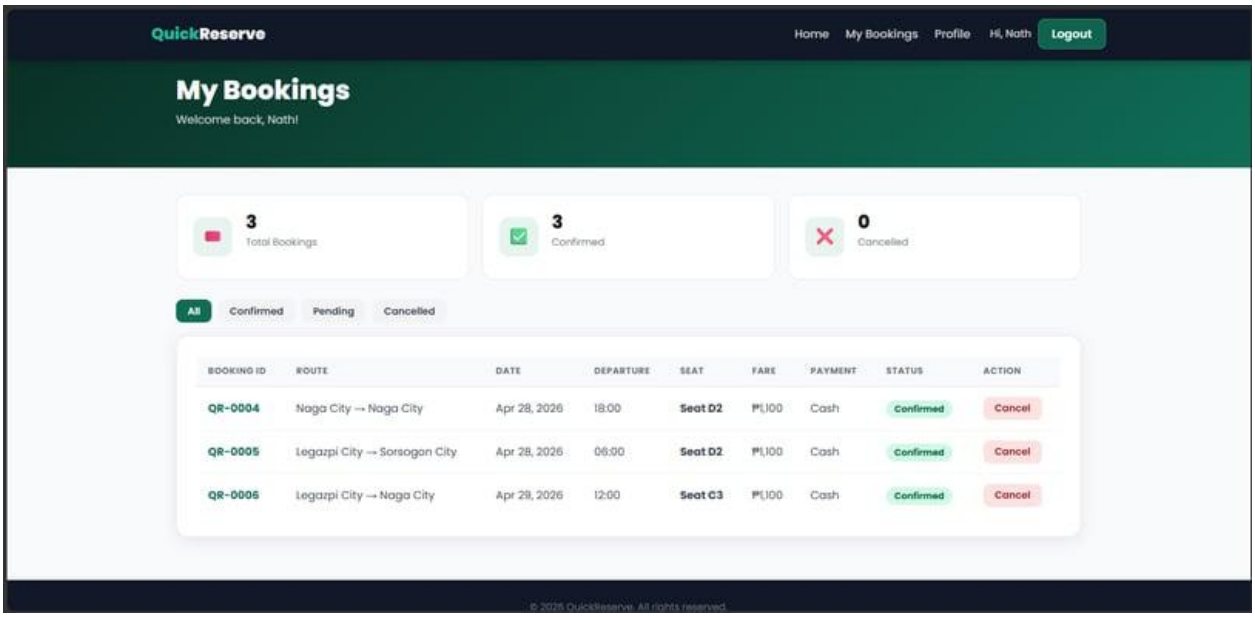
8. Booking Confirmation Page

After completing the booking process, this page displays a confirmation message along with a unique booking reference number. It also summarizes the trip details, ensuring that users have a record of their successful transaction.



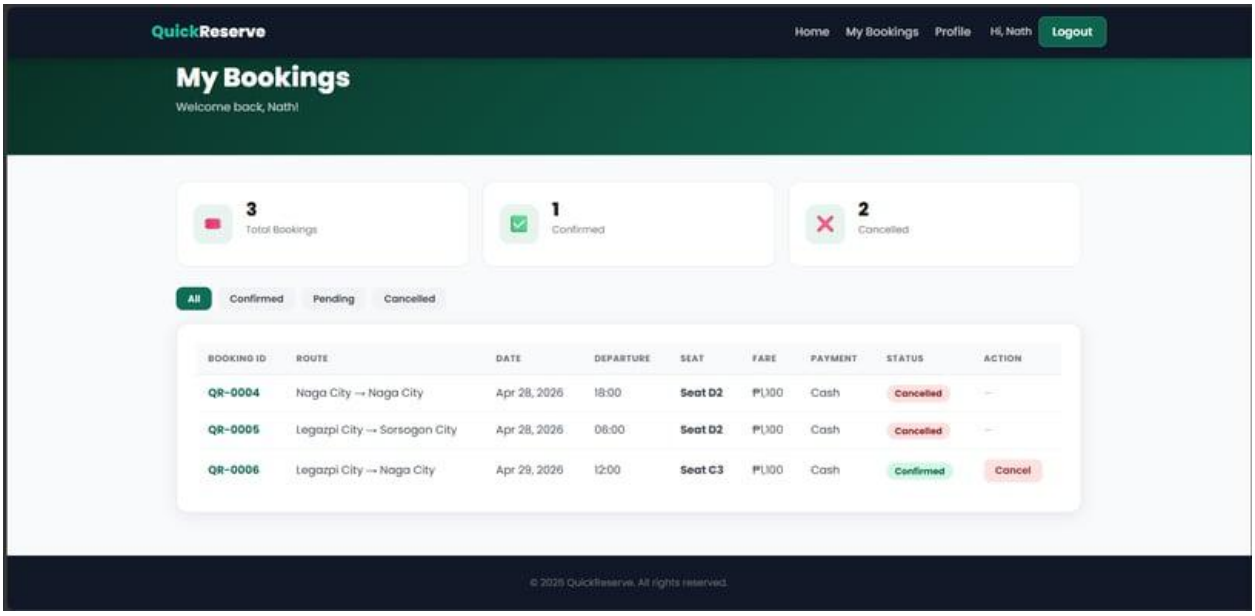
9. My Bookings Page (All Bookings)

This page provides users with a complete overview of all their bookings. It includes booking details such as route, date, seat, payment method, and status, allowing users to easily track their transactions.

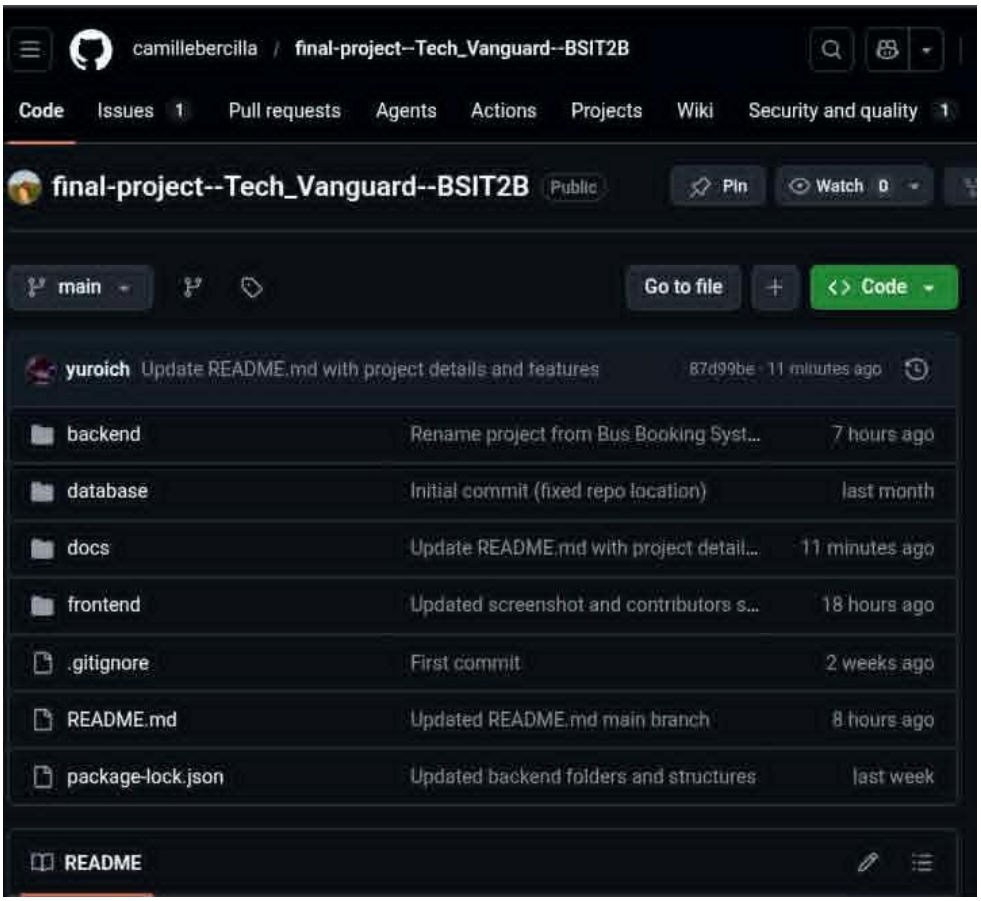


10. My Bookings Page (Filtered Status: Confirmed/Cancelled)

This page demonstrates the filtering functionality, where users can sort bookings based on their status (e.g., confirmed or cancelled). It helps users efficiently manage and monitor their booking history.



III. Screenshot of GitHub folder structure



IV. Screenshot of GitHub folder structure Individual reflections from each group member (3–5 sentences)

Each member of the group was given a specific responsibility to contribute to the successful development, testing, and documentation of the **Quick Reserve:Online Bus & Travel Booking System.**

Nathaniel O. Raynada – Project Manager
Creating the frontend of our QuickReserve Bus Booking System helped me improve both my technical and leadership skills. I focused on designing a simple and user-friendly interface, which taught me the importance of usability in design. Managing the group also improved my communication and teamwork. Overall, this experience helped me grow as a more responsible and effective developer.

Anna Mae P. Broma – Back-End Developer

I contributed as the backend developer by preparing the system for deployment and ensuring that the server, database connection, and environment variables were properly configured. I verified that the application runs locally and successfully connects to MongoDB Atlas before pushing it to GitHub and deploying it on Render. This phase helped me understand the importance of secure configurations, especially using .env files and handling errors during deployment. I also realized how frontend and backend integration depends on properly structured APIs, which we prepared in earlier phases. Overall, this experience improved my skills in deployment, debugging, and maintaining a functional web system in a live environment.

Camille Bercilla – GitHub Manager

I organized the frontend into a clear, modular directory structure within the /frontend folder, ensuring each page and asset type is easy to manage and scalable as the project evolves. I also suggested using a consistent styling approach through structured practices to maintain clean and maintainable design, while ensuring proper branch merging with clear commit logs. This contribution improves team coordination and ensures the project remains organized, maintainable, and aligned with development goals.

Mariel O. Odoño – Documentation Officer

I was responsible for preparing the project documentation by capturing relevant screenshots and explaining how each feature aligns with the system's requirements. I also compiled and organized the technical details into a clear and structured report. Through this task, I realized the importance of proper documentation in explaining and supporting system development.

John Edmar Bongcodin – System Tester

I took on the role of tester and debugger for our Quick Reserve project, focusing on finding and fixing system issues. I reviewed different features to ensure they functioned properly and met the set requirements. This experience helped me strengthen my troubleshooting, debugging, and problem-solving skills while ensuring the system was stable and ready for deployment.

Justin Dasallas – Front-End Developer

I helped in documentation by capturing screenshots of the system and providing sample codes. I also ensured that the documentation matches the system's actual functionality. In addition, I assisted in checking the user interface to make sure it is clear and easy to use.
